Progressus Advanced Projects

Release Notes

Build 10.3.0.4, US 10.3.0.0 and CA 10.3.0.0

Requires minimum of BC 22.0

Application Enhancements

Billing

- **Enhancement Request 72790:** Microsoft has offered a new feature **Enable use of new extensible invoice posting engine**.

New Feature: Progressus is now compatible with the feature. Microsoft has planned to require this feature be enabled with Release 2023 Wave 2. It is recommended you test this new feature in a sandbox with any customizations developed for the invoicing process.

System Wide

- **Notice #69284:** Code changes were required by Microsoft to be compliant with new development standards in Business Central. These changes are related to dimension handling within Progressus and should not impact customer results. It is recommended you evaluate key processes to ensure dimensions are posting as expected.

Bug Fixes

Costing and Pricing

- **Issue 69285:** User receives locking error: "**We can't save your changes right now, because a record in Resource Prices is being updated in a transaction done by another session**". This occurs when using a template to create sales prices.

Resolution: The issue is resolved and users will no longer encounter a locking error when they load templates at the same time.

Project

- **Issue 68056:** Slow performance is experienced when adding a sales price list to a project.

Resolution: The performance issue experienced when loading a sales price template to a project is resolved. The logic has been changed to save the resource price after each record is inserted and avoid a large data set from saving all at once.

Reports

- **Issue 67778:** The **Total Usage Price (LCY)** on the Power BI report - **Project Overview > Reports** tab > **Price (Actual)** is incorrect. The usage price on the BI Report does not match the price on Time entries. The report should not include sales invoice entries in the totals for price actual and cost actual.

Resolution: The query for the **Project Overview > Reports** tab is modified to correct the **Price (Actual)** amount. We added the **Entry Type** field to the **Object ID 14045650 Power_BI_Project_Actuals_PGS** query in web services that allows filtering based on usage lines only. This offers users the ability to change the formulas within their BI report. The Power BI report has been modified and renamed to **Progressus_BC_Project_Analytics_July212023.pbix**. The new file can be downloaded from this link:

https://docs.progressussoftware.com/articles/downloads/Progressus_BC_Project_Analytics_July212023.pbix

Vacation/Flex

- **Issue 49207:** Task Dimensions are missing on the posted Flex Time entries. This occurs when the **Automatic Flex Adjustment** option on the **Timesheet Configuration** is enabled and the dimensions are specified for the Flex Time entries.

Resolution: The dimensions are copied properly on the adjusting flex entry line that is created.
